

A (debatably) Brief Introduction to Python

ASSIGNMENT 2: STRINGS

Here are the problems:

- Create a function `mutate_string(str)` that adds “asdf” to the beginning of `str`.
- Create a function `fix_string(mutated)` that removes “asdf” from the beginning of `mutated`. Hint: there are 2 ways to solve this: either use `replace()`, or use indexing.
- Take a look at the `nltk` library (nltk.org).
