A (debatably) Brief Introduction to Python

Some basic stuff, really:

- Create an empty list called `list1`. Add the value 5 to it 100 times.
- Create a function `sum(my_list)` that takes in a list and sums all its values.
- Create an empty dictionary called `dict1`. Add five items to it with whatever keys you want.
- In the space below all those functions, revisit `sys.argv` (don't forget to add an import statement at the top). Using a for loop, print every argument.
